

## Certificate Authority Implementation

1. Insure that the following are running. Set up DNS, AD.
2. Make sure the account you are installing under has Enterprise Admin rights.
3. Click start> Control Panel> Add remove programs> Add/Remove Windows Components> Certificate Services> Certificate Services CA.
4. If this is your first CA server choose Enterprise. Enterprise is only available if you have AD install, otherwise the CA will be a stand-alone. Make sure this is not on the same computer as your email or web server to ensure security. These are the targeted the most.
